U.S. Citizen | Eligible for and willing to obtain a U.S. government security clearance

PROFESSIONAL SUMMARY

CompTIA Security+ certified CyberCorps® Scholarship for Service scholar pursuing a Bachelor of Science in Business Administration, Computer Information Systems, at California State Polytechnic University, Pomona; expected May 2028. Hands-on experience in Linux security, vulnerability remediation, virtualized infrastructure, identity and access management, and competition-based incident triage. Seeking a government cybersecurity internship and post-graduation public-service role protecting systems, networks, information, and critical infrastructure.

CYBERSECURITY AND TECHNICAL SKILLS

Security operations and vulnerability assessment: Competition-based incident triage; vulnerability and misconfiguration assessment; secure configuration and system hardening

Network, systems, and identity security: Active Directory account and permission administration; virtual LANs (VLANs); firewall configuration; least privilege access

Cloud and virtualization: Proxmox Virtual Environment (VE), virtual machine provisioning, virtual networking; exposure to Amazon Web Services (AWS) infrastructure and EC2 through CyberForce and coursework

Security and development tools: Wireshark, tcpdump, Nmap, iptables, Burp Suite

Operating systems: Debian, Ubuntu, Kali Linux, Windows Server

Programming and databases: Python, Java, Bash, SQL

Technical communication: Security presentations, hands-on workshops, vulnerability documentation, remediation recommendations, and team collaboration

EDUCATION

Bachelor of Science in Business Administration, Computer Information Systems

Expected May 2028

California State Polytechnic University, Pomona

Pomona, CA

GPA: 3.98

Scholarship: CyberCorps® Scholarship for Service (SFS) Scholar, Cal Poly Pomona SFS Program, August 2026-Present

Relevant coursework: CIS 2650 Contemporary Operating Systems; CIS 2100 Programming for Business (Python); CIS 3050 Database Design and Development (SQL); CIS 2900 Object-Oriented Programming for Business (Java)

CERTIFICATION

- CompTIA Security+ (SY0-701), earned August 30, 2025; active

WORK EXPERIENCE

Student Director and Hill Family Fellow, Mitchell C. Hill Student-Run Data Center

July 2026-August 2026

California State Polytechnic University, Pomona

Pomona, CA | 10 hours/week

- Administered a multi-node Proxmox VE environment by provisioning virtual machines and configuring virtual networks and VLANs for student laboratories and technical projects.
- Managed Active Directory user accounts and permissions, supporting controlled access to Student Data Center resources.
- Applied operating-system and package updates to remediate vulnerabilities identified in a Rapid7 scan.
- Maintained physical data-center infrastructure and assisted with installing an uninterruptible power supply to support equipment power reliability.

LEADERSHIP EXPERIENCE

Director of Competitions

August 2026-Present

Cal Poly Pomona Students With an Interest in the Future of Technology (SWIFT)

Pomona, CA | 6 hours/week

- Direct development of in-house cybersecurity competitions and tryout environments for SWIFT's competitive program, building on prior experience developing capture-the-flag challenges as Competitions Officer.
- Built a CyberForce team tryout environment on a Debian virtual machine hosted through Proxmox VE in the Student Data Center, designing capture-the-flag challenges to evaluate and select incoming team members.
- Develop a second tryout environment for the NCAE Cyber Games team, scheduled for Winter 2026.
- Plan two upcoming in-house competitions — a Purple vs. Purple exercise and a Red vs. Blue competition — including challenge design and infrastructure requirements.

Competitions Officer

August 2025-May 2026

Cal Poly Pomona Students With an Interest in the Future of Technology (SWIFT)

Pomona, CA | 3 hours/week

- Supported development of the Spring 2026 SWIFT Red vs. Blue competition by using Proxmox VE to provision and host Debian 12 and Windows Server 2022 virtual machines on Student Data Center infrastructure.

CYBERSECURITY COMPETITION EXPERIENCE

CyberForce Competition - Linux Team Member

September 2025-November 2025

U.S. Department of Energy | Six-person team

Tinley Park, IL | approximately 15 hours/week

- Maintained Linux-based web, mail, file-sharing, and remote-access services while briefly reviewing Wazuh alerts as part of incident triage and remediating issues during a live adversarial competition.
- Contributed to a six-person team vulnerability assessment that identified and documented more than 100 vulnerabilities and misconfigurations and developed prioritized remediation recommendations.
- Recommended infrastructure and monitoring improvements during a simulated executive presentation to strengthen incident-response readiness for an industrial control systems environment.
- Worked within competition infrastructure provided through AWS while coordinating Linux defense responsibilities with a six-person cybersecurity team.

CYBERSECURITY PROJECTS AND LABORATORY EXPERIENCE

Linux Hardening Presentation and Workshop - Presenter

March 2026

Cal Poly Pomona SWIFT weekly club meeting

Pomona, CA

- Designed and led a hands-on Linux hardening workshop for approximately 15 participants, building a bridged Kali Linux and Ubuntu 24.04 lab with intentionally vulnerable configurations spanning initial access, privilege escalation, and persistence.
- Guided participants in using Nmap, ss, tcpdump, and Wireshark to identify weaknesses, then remediate insecure services and SSH settings, excessive sudo, SUID, and capability permissions, unauthorized root accounts, web shells, and systemd persistence before retesting fixes.
- Taught least privilege and defense-in-depth practices by auditing Linux accounts and file permissions, configuring default-deny iptables policies, and backing up and restoring firewall rules.

NCAE Cyber Games – Web Service

March 2026

National Security Agency (NSA)

Pomona, CA

- Reviewed a Python Flask application's source code and identified server-side template injection, command injection, SQL injection, insecure password-recovery logic, and exposed debug functionality.
- Remediated vulnerabilities using parameterized PostgreSQL queries, input validation, access controls, and secure error handling, then used AI-assisted tools to identify and patch newly discovered issues in real time during the live competition.
- Hardened and deployed the application in a local Proxmox VE environment with a TLS-enabled Nginx reverse proxy, restricted systemd service, and iptables rules, then generated SSL certificates from the competition's internal CA and configured static IP addressing to sustain uptime during the live competition.
- Contributed as part of a 10-member competition team to a final score of 5,030 points (2,680 service points, 1,750 CTF points, 600 bonus points), achieving 88% uptime on the team's top-performing service and capturing 24 of 26 flags in a live-fire network defense competition.

Hack The Box – Web Application Security Labs

Ongoing

Independent practice

Remote

- Completed 10 Hack The Box labs, using Burp Suite to intercept and manipulate HTTP requests, test input handling, and identify exploitable vulnerabilities.
- Exploited an insecure direct object reference (IDOR) on the “Cap” machine by modifying a URL parameter to access another user's packet capture data and recover reused credentials.
- Identified and exploited a SQL injection vulnerability in a web application parameter on the “Jarvis” machine to extract database contents and establish a foothold.

Bootcamp Participant

August 2026-Present

Cal Poly Pomona CCDC Bootcamp

Pomona, CA | 5 hours/week

- Diagnosed and remediated Linux and Windows Server misconfigurations in a hands-on lab, restoring secured SSH root access, isolating database access to the correct host, and disabling anonymous FTP login.
- Corrected Windows Server RDP permissions to restrict remote access to a single authorized user, rebuilt firewall rules to allow only required services, and configured a DNS record to resolve a production website.
- Built a multi-OS Active Directory domain in a lab environment — promoted a Windows Server to a domain controller, joined a Debian VM to the domain, and provisioned domain user accounts, while restricting remote access (SSH/RDP) and file shares (FTP/SMB) to specific authorized accounts.
